Department	Management Information System
Project Topic	A Cost-Effective Predictive HR Analytics Framework for Sri Lankan SMEs Using Cloud-Native Serverless AI
Supervisor Comments	The research proposal presents a well-developed and technically strong study focusing on the design of a cost-effective predictive HR analytics framework for Sri Lankan SMEs using cloud-native serverless AI. The proposal clearly explains the background, research gap, and practical importance of applying predictive analytics to employee attrition in SMEs. The research questions, objectives, and Design Science Research methodology are clearly aligned with the aim of developing and evaluating an AI-driven HR analytics module integrated into an existing HRMS. The proposal also demonstrates good academic grounding through the use of relevant literature, clearly defined evaluation metrics, and consideration of ethical issues such as data privacy and compliance with the Sri Lanka Personal Data Protection Act. However, some sections could be improved by simplifying overly technical explanations and ensuring clearer linkage between the research questions, methodology, and expected contributions. Overall, the proposal shows strong potential to contribute both academically and practically by providing an accessible predictive analytics solution tailored to the SME context in Sri Lanka.
